**Text:**

The level of agreement among peer review physicians analyzing the same medical records for quality of care is so poor that the entire process is due for a "global reexamination," according to a researcher at the U.S. Department of Veterans' Affairs in Washington DC. Ronald Goldman, MD, looked at 12 studies that examined "interreviewer reliability," finding, in most instances, rates "only slightly better than the level expected by chance."

Agreement rates improve when reviewers are required to discuss disputed cases, according to Goldman. In one study, the rate of consensus improved from 65 percent to 93 percent of cases when physicians were obliged to thrash out disagreements. (In that study consensus was defined as agreement among five of six medical specialists or seven of nine surgical experts.)

Objective assessment criteria, the use of **specialists trained** in **quality** assessment, and scoring findings in a way that accounts for individuals' known biases all improve peer review, says Goldman. He concurs with findings by RAND researcher Robert Brook, MD, and others who find "notably higher agreement" levels when criteria address outcomes as well as processes of care.

"Carefully worded outcome questions may require less attention to the seemingly ambiguous concept of the standard of care," says Goldman. His report appears in the Feb. 19 Journal of the American Medical Association.
